

TWISTED TAPE |

Turbulators

The twisted tape turbulator is most often (but not exclusively) used in shell & tube heat exchangers having fluid inside of the tubes. It is available for tube sizes up to 4" diameter and can be created using a variety of materials. Twisted tape turbulators are custom-made to fit your specifications.

In the past, twisted tape turbulators have also been used in firetube boiler applications. We have the capability to manufacture replacements that meet a large range of specifications.
